
Justin Bishay

Website Portfolio: <https://jkbishay.github.io>

Email: justinkb47@gmail.com

LinkedIn: <https://www.linkedin.com/in/justin-bishay-022890156/>

Skills

Programming Languages: C++, C, C#, Python, JavaScript, Java, HTML/CSS

Game Engines: Tiger Engine (Destiny 2/Marathon), Unity, Unreal Engine, Godot

Tools/Software: Visual Studio, Git, Perforce

Education

M. S. in Computer Science

December 2021, University of Hawai‘i at Mānoa

B. S. in Computer Science

August 2019, University of Hawai‘i at Mānoa

Work Experiences

Bungie

Bellevue, WA

Gameplay Engineer

January 2022 - June 2026

Made substantial changes and contributions to proprietary engine technology to satisfy new needs and demands

- Solved complex problems within a multi-process networking system including server, client, and host processes to support PvE and PvP activities
- Investigated and proposed new script debugging system to senior engineers; proceeded to develop system so multiple disciplines could better understand scripted content
- Implemented new matchmaking systems and optimizations to support novel game mode
- Explored several places in engine where improvements could be made to debugging tools performance monitoring of network traffic

Collaborated across interdisciplinary teams on various gameplay related systems and features

- Proposed technical specs to design and engineering leadership to align on plans to deliver the technical needs to support new content and adjusted deliverables to accommodate late pivots from project leadership
- Coordinated with design, engineering, and test to diagnose bugs and align on fixes
- Provided engineering feedback for other engineers on code reviews and for designers on scripting for raid, dungeon, and seasonal activity content

Engineering Intern

May 2021 - August 2021

- Developed the skillset to navigate a large codebase and identify the areas that are relevant to current feature work
- Improved velocity and thus was able to take on more tasks than originally intended to further contribute to the smooth launch of cross-play in Destiny 2 and Marathon
- Identified areas where additional improvements could be made to the cross-play feature and proposed such ideas to the team and later implemented them

Laboratory for Advanced Visualization Applications**Honolulu, HI****Graduate Research Assistant****August 2019 - December 2021**

Implemented cloud pixel streaming application for data visualization applications across several types of hardware clients for US Military research

- Coordinated project responsibilities with professionals and other students to solve problems around client performance, networking render data, and streamed imagery resolution
- Learned how to navigate the layer between C# and C++ code when networking data across processes built with different programming languages

Undergraduate Research Assistant**January 2018 - May 2019**

Developed augmented reality training application requested by the US Navy

- Joined midway through project and collaborated with computer engineering student to learn the existing codebase and how to develop for augmented reality technologies
- Took over and led development of the project to completion after labmate graduated
- Received feedback on UI/UX from a PhD student and learned how to implement those concepts in an augmented reality space
